

February is Dental Health Month

Saltwater Animal Hospital takes pride in providing meticulous dental cleanings for cats and dogs; here are three key things to know about your pet and their dental health:

Bad Breath Should Not Be Ignored

By age 3, many of our patients face untreated periodontal disease, leading to pain, inflammation, tooth loss, and organ damage, often concealed beneath the gum line without clear symptoms.

The Treatment is Prevention

While brushing and providing dental chews are essential for oral hygiene, professional teeth cleaning (scaling and polishing) remains irreplaceable.

Professional Cleanings Require Anesthesia

Anesthesia is crucial for a comprehensive examination and cleaning, especially below the gum line, utilizing an ultrasonic scaler to ensure efficiency and minimize anesthesia duration.
